The problem of gardening of the steppe cities with the increased level of aero technogenic influence is very actual since the cities become the main habitat of the person.

Gardening and landscaping are the domain of the cities that are most susceptible to the implementation of new concepts and theoretical positions.

Currently, the acute question is to balance opportunities for the formation of the city green areas and the needs of the citizens in comfortable, efficient and aesthetically decorated spaces. Landscape architecture and landscaping - a branch of the municipal economy, the purpose of which is the most favorable functional and spatial organization of the environment in different areas of life; stable transformation of landscapes and their protection; solution of problems of aesthetic social ecology.

Keywords: dendroflor, environment, vital state, monitoring researches, look, steady range.
